

Do you have one room  
that feels like  
this or that  
even when the rest of your  
home is very comfortable?

**IT IS A DILEMMA!**

When one room is **too hot** or **too cold**

Call **AIRNOW - 623-932-1674**

**We have solutions!**

**THE COMMON CAUSE: LACK OF DAMPERS IN THE DUCT WORK**

Interestingly, Arizona building codes do not require dampers in the duct work when a house is built. Other parts of the country require dampers as a way to balance airflow. This means you will not have the situation where some rooms get all the "cooled" or "heated" air leaving other rooms with little airflow. Generally, without dampers, the rooms closest to the air handler blower get a higher percentage of the cooled or heated air. As the air has to travel farther and farther away, the lack of dampers to manage the distribution of airflow causes those rooms to get the least amount of air.

**SOLUTION: ADD DAMPERS TO THE DUCTWORK TO BALANCE THE AIR FLOW**

Dampers are devices that are strategically placed in the ductwork throughout a home. They are adjusted to provide airflow that is evenly distributed throughout the house so that your airflow and temperatures will be balanced throughout the home.

**DAMPER PACKAGE SPECIAL \$477**

**FOR UP TO 8 DAMPERS & AIR BALANCING**

Let us diagnose whether a Damper Package is the solution to your airflow problem during your seasonal preventive maintenance tune-up.
